Hardware Installation Manual

Edition 05/2010, Firmware version 4.3
Legal information

Warning notice system
This manual contains notices you have to observe in order to ensure your personal safety, as well as to prevent damage to property. The notices referring to your personal safety are highlighted in the manual by a safety alert symbol, notices referring only to property damage have no safety alert symbol. These notices shown below are graded according to the degree of danger.

⚠️ DANGER
indicates that death or severe personal injury will result if proper precautions are not taken.

⚠️ WARNING
indicates that death or severe personal injury may result if proper precautions are not taken.

⚠️ CAUTION
with a safety alert symbol, indicates that minor personal injury can result if proper precautions are not taken.

CAUTION
without a safety alert symbol, indicates that property damage can result if proper precautions are not taken.

NOTICE
indicates that an unintended result or situation can occur if the corresponding information is not taken into account.

If more than one degree of danger is present, the warning notice representing the highest degree of danger will be used. A notice warning of injury to persons with a safety alert symbol may also include a warning relating to property damage.

Qualified Personnel
The product/system described in this documentation may be operated only by personnel qualified for the specific task in accordance with the relevant documentation for the specific task, in particular its warning notices and safety instructions. Qualified personnel are those who, based on their training and experience, are capable of identifying risks and avoiding potential hazards when working with these products/systems.

Proper use of Siemens products
Note the following:

⚠️ WARNING
Siemens products may only be used for the applications described in the catalog and in the relevant technical documentation. If products and components from other manufacturers are used, these must be recommended or approved by Siemens. Proper transport, storage, installation, assembly, commissioning, operation and maintenance are required to ensure that the products operate safely and without any problems. The permissible ambient conditions must be adhered to. The information in the relevant documentation must be observed.

Trademarks
All names identified by © are registered trademarks of the Siemens AG. The remaining trademarks in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owner.

Disclaimer of Liability
We have reviewed the contents of this publication to ensure consistency with the hardware and software described. Since variance cannot be precluded entirely, we cannot guarantee full consistency. However, the information in this publication is reviewed regularly and any necessary corrections are included in subsequent editions.

Introduction

1.1 System overview of the SINAMICS G120P

The SINAMICS G120 range

The SINAMICS G120 inverter has been designed for the accurate and efficient control of the speed and torque for three-phase motors. The SINAMICS G120P is a specific sub-system focused on the HVAC industry sector and for pump and fan applications.

The PM230 Power Modules supply the necessary power to the Control Units and the attached motor. The PM230 output ranges from 0.37 kW to 90 kW and is rated IP55 (UL Type 12).

See the respective manual for specific functions and features.

Available Power Modules PM230

The various types of PM230 Power Modules are listed below. The given power rating values are defined for "low overload" operation.

- **PM230 Power Modules with integrated filter Class A**
  3 AC, 380 V … 480 V ± 10%, IP55 (UL Type 12), Frame size A … F, 0.37 kW … 90.0 kW

- **PM230 Power Modules with integrated filter Class B**
  3 AC, 380 V … 480 V ± 10%, IP55 (UL Type 12), Frame size A … F, 0.37 kW … 90.0 kW

Control Unit - CU230P-2

The CU230P-2 is a Control Unit that has been optimized for pumps and fans. It can be operated with the PM230 Power Module.

- CU230P-2 HVAC with RS485 interface for USS, Modbus RTU and BacNet MS/TP
- CU230P-2 CAN with CANopen interface
- CU230P-2 DP with PROFIBUS DP interface

The Control Unit can be commissioned either using the STARTER commissioning software or the optional Intelligent Operator Panel (IOP).

You can save all the settings you enter during commissioning and operation to a memory card.
1.1 System overview of the SINAMICS G120P

Intelligent Operator Panel

The Intelligent Operator Panel (IOP) has been designed to enhance the interface and communications capabilities of the SINAMICS G120P Inverters.

Rating label information

Every Power Module has a rating label which details the specifications of the Power Module. The specifications shown on the rating label can vary due to the requirements of specific regulations and compliance standards imposed by the country of origin and the final destination of the product.

Detailed below is an explanation of all the information that might appear on a typical rating label of a Power Module.

![Rating Label Example](image)

#### Order Number

Each type of Power Module has a unique order number, also known as the MLFB (Maschinen lesbare Fabrikatebezeichnung). The order number contains detailed information regarding the type and specification of the product. In the figure below details of how the order number is constructed are given.

**Figure 1-2 Breakdown of Order Number (MLFB)**

- **Order Number**
  - 6 S L 3 2 2 3 - 0 D E 1 3 - 7 A A 0
  - B IP20/ UL open type
  - C IP21/ UL type 1
  - D IP55/ UL type 12
  - N Push through

- **EMC Filter**
  - A EMC filter class A
  - B EMC filter class B
  - U No EMC filter, unfiltered

- **Power Ratings**
  - 1 3 - 7 0.37 kW
  - 1 5 - 5 0.55 kW
  - 1 7 - 5 0.75 kW
  - 2 1 - 1 1.1 kW
  - 2 3 - 5 1.5 kW
  - 2 2 - 2 2.2 kW
  - 2 3 - 0 3.0 kW
  - 2 4 - 0 4.0 kW
  - 2 5 - 5 5.5 kW
  - 2 7 - 5 7.5 kW
  - 3 1 - 1 11 kW
  - 3 3 - 5 15 kW
  - 3 2 - 2 16.5 kW
  - 3 3 - 0 22 kW
  - 3 3 - 7 37 kW
  - 3 4 - 5 45 kW
  - 3 5 - 5 55 kW
  - 3 7 - 5 75 kW
  - 3 8 - 8 90 kW

1.2 Documents for the Inverter

Available technical documentation

Comprehensive information and support tools are available from the Service and Support internet site at the following link:

- http://support.automation.siemens.com

Examples of the types of documentation and support tools available for downloading are:

- Getting Started Guides
- Operating Instructions
- Hardware Installation Manuals
- Parameter Manuals
- STARTER commissioning software

Documents for the Control Unit CU230P-2

Since the CU230P-2 Control Unit has been designed to support the HVAC environment; the following documents for the CU230P-2 can be found at the links below:

- Getting Started Guide
- Operating Instructions
- Parameter Manual

Further internet addresses

You find various application examples to the inverters under the following link:

Introduction

1.2 Documents for the Inverter
Safety notes

Safety Instructions

The following Warnings, Cautions and Notes are provided for your safety and as a means of preventing damage to the product or components in the connected machines. This section lists Warnings, Cautions and Notes, which apply generally when handling the inverter, classified as General, Transport and Storage, Commissioning, Operation, Repair and Dismantling and Disposal.

Specific Warnings, Cautions and Notes that apply to particular activities are listed at the beginning of the relevant sections in this manual and are repeated or supplemented at critical points throughout these sections.

Please read the information carefully, since it is provided for your personal safety and will also help prolong the service life of your inverter and the equipment to which it is connected.

It has to be ensured by the machine manufacturer, that the line-side overcurrent protection equipment interrupts within 5 s (immovable equipment and modules in immovable equipment) in the case of minimum fault current (current on complete insulation failure to accessible conductive parts that are not live during operation and maximum current loop resistance).

The machine manufacturer must ensure that the voltage drop between the main power supply and the power drive system, during operation, does not exceed 1 % (UK < 1 %).
## General

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>This equipment contains dangerous voltages and controls potentially dangerous rotating mechanical parts. Non-compliance with the warnings or failure to follow the instructions contained in this manual can result in loss of life, severe personal injury or serious damage to property.</td>
</tr>
</tbody>
</table>

Protection in case of direct contact by means of SELV / PELV is only permissible in areas with equipotential bonding and in dry indoor rooms. If these conditions are not fulfilled, other protective measures against electric shock must be applied e.g. protective insulation.

Only suitably qualified personnel should work on this equipment, and only after becoming familiar with all safety notices, installation, operation and maintenance procedures contained in this manual. The successful and safe operation of this equipment is dependent upon its proper handling, installation, operation and maintenance.

As the earth leakage for this product can be greater than 3.5 mA a.c., a fixed earth connection is required and the minimum size of the protective earth conductor shall comply with the local safety regulations for high leakage current equipment. In this case a permanent, immovable connection is required and the following measures must also be taken:

- Minimum PE conductor cross-section of 10 mm².
- Laying a second PE conductor using separate terminals, with a cross-section that, in itself, fulfills all the requirements for PE conductors.
- Self-actuating switch-off of the power supply if the PE conductor is interrupted.
- Insertion of a two-winding transformer into the power supply.

Due to the high inrush currents in the earth conductor, this product is not compatible with an RCD (also referred to as an ELCB or RCCB).

The power supply, DC and motor terminals, the brake and thermistor cables can carry dangerous voltages even if the inverter is inoperative. Wait at least five minutes to allow the unit to discharge after switching off the line supply before carrying out any installation work.

It is strictly prohibited for any mains disconnection to be performed on the motor-side of the system; any disconnection of the mains must be performed on the mains-side of the Inverter.

When connecting the line supply to the Inverter, make sure that the terminal case of the motor is closed.

During operation and for a short time after switching-off the Inverter, the surfaces of the Inverter can reach a high temperature.

This equipment is capable of providing internal motor overload protection according to UL508C. Refer to P0610 and P0335, $i^2$t is ON by default.

When changing from the ON to OFF-state of an operation if an LED or other similar display is not lit or active; this does not indicate that the unit is switched-off or powered-down.
The inverter must always be grounded.
Isolate the line supply before making or changing connections to the unit.
Use of mobile radio devices (e.g. telephones, walkie-talkies) with a transmission power > 1 W in the immediate vicinity of the devices (< 1.8 m) can interfere with the functioning of the equipment.
Do not disconnect power connections when the Inverter and motor are under load.
Ensure that the inverter is configured for the correct supply voltage. The inverter must not be connected to a higher voltage supply.

Static discharges on surfaces or interfaces that are not generally accessible (e.g. terminal or connector pins) can cause malfunctions or defects. Therefore, when working with inverters or inverter components, ESD protective measures should be observed.
Take particular notice of the general and regional installation and safety regulations regarding work on dangerous voltage installations (e.g. EN 50178) as well as the relevant regulations regarding the correct use of tools and personal protective equipment (PPE).

**CAUTION**
Children and the general public must be prevented from accessing or approaching the equipment!
This equipment may only be used for the purpose specified by the manufacturer. Unauthorized modifications and the use of spare parts and accessories that are not sold or recommended by the manufacturer of the equipment can cause fires, electric shocks and injuries.

**NOTICE**
Keep this manual within easy reach of the equipment and make it available to all users.
Whenever measuring or testing has to be performed on live equipment, the regulations of Safety Code BGV A2 must be observed, in particular § 8 "Permissible Deviations when Working on Live Parts". Suitable electronic tools should be used.
Before installing and commissioning, please read these safety instructions and warnings carefully and all the warning labels attached to the equipment. Make sure that the warning labels are kept in a legible condition and replace missing or damaged labels.

**Transport and storage**

**WARNING**
Correct transport, storage as well as careful operation and maintenance are essential for the proper and safe operation of the equipment.
Safety notes

CAUTION

Protect the equipment against physical shocks and vibration during transport and storage. It is important that the equipment is protected from water (rainfall) and excessive temperatures.

Commissioning

WARNING

Working on the equipment by unqualified personnel or failure to comply with warnings can result in severe personal injury or serious damage to material. Only suitably qualified personnel trained in the setup, installation, commissioning and operation of the product should carry out work on the equipment.

CAUTION

Cable connection

The control cables must be laid separately from the power cables. Carry out the connections as shown in the installation section in this manual, to prevent inductive and capacitive interference from affecting the correct function of the system.
Operation

⚠️ WARNING

The Inverter operate at high voltages.

When operating electrical devices, it is impossible to avoid applying hazardous voltages to certain parts of the equipment.

Emergency Stop facilities according to EN 60204, IEC 204 (VDE 0113) must remain operative in all operating modes of the control equipment. Any disengagement of the Emergency Stop facility must not lead to an uncontrolled or an undefined restart of the equipment.

Certain parameter settings may cause the Inverter to restart automatically after an input power failure, for example, the automatic restart function.

Wherever faults occurring in the control equipment can lead to substantial material damage or even grievous bodily injury (that is, potentially dangerous faults), additional external precautions must be taken or facilities provided to ensure or enforce safe operation, even when a fault occurs (e.g. independent limit switches, mechanical interlocks, etc.).

Motor parameters must be accurately configured for motor overload protection to operate correctly.

This equipment is capable of providing internal motor overload protection according to UL508C.

Only Inverters with fail-safe functions can be used as an "Emergency Stop Mechanism" (see EN 60204, section 9.2.5.4).

Repair

⚠️ WARNING

Repairs on equipment may only be carried out by Siemens Service, by repair centers authorized by Siemens or by authorized personnel who are thoroughly acquainted with all the warnings and operating procedures contained in this manual.

Any defective parts or components must be replaced using parts contained in the relevant spare parts list.

Disconnect the power supply before opening the equipment for access.

Dismantling and disposal

⚠️ CAUTION

The packaging of the Inverter is re-usable. Retain the packaging for future use.

Easy-to-release screw and snap connectors allow you to break the unit down into its component parts. You can recycle these component parts, dispose of them in accordance with local requirements or return them to the manufacturer.
Installing/Mounting

⚠️ WARNING

To ensure the safe operation of the equipment, it must be installed and commissioned by qualified personnel in full compliance with the warnings laid down in this manual.

Take particular note of the general and regional installation and safety regulations regarding work on dangerous voltage installation (e.g. EN 61800-5-1) as well as the relevant regulations regarding the correct use of tools and personal protective equipment (PPE).

General rules for the environmental protection of the Power Modules

To ensure that the power module is installed in the correct environmental conditions, please ensure that you adhere to the following guidelines:

- The Power Module FSA … FSF is designed for IP55 protection. It is protected against dust-limited ingress (no harmful deposit) and against low pressure jets of water from all directions (although limited ingress is permitted).
- Although the Power Module is protected against the ingress of water, this is dependent on the correct fitting of any seals, including the seals necessary for the fitting of an operator panel.
- Keep the Power Module free from dust and dirt.
- Keep the Power Module away from solvents and chemicals.
- Keep the Power Module within the maximum and minimum operating temperatures.
- Ensure that the correct level of ventilation and air flow is provided
- Ensure that earthing and grounding practices for each Power Module follows the guidelines given in this document.

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
</table>
| **Heatsink retaining screws**

The heatsinks of the PM230 IP55 Power Modules (FSA to FSC) are fixed to the main housing of the Power Module by a number of retaining screws. These screws MUST not be removed. The heatsink retaining screws are shown in the figure below (circled in red).

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
</table>
| **Mounting and cooling of the Power Module**

The Power Module should be wall-mounted to ensure that the rear of the Power Module is against a flat surface, thereby allowing the correct airflow to provide the optimum cooling for the Power Module. Alternatively, if the Power Module is not wall-mounted the rear of the heatsink must be covered with a flat surface to ensure the correct airflow.

It is important to ensure that the internal fans of the Power Modules are fitted correctly before the Inverter is operated. Failure to ensure that the fans are connected correctly could result in the Inverter overheating.

### 3.3 Control Unit installation

#### Fitting the CU to the PM FSA ... FSF

**Note**

**Memory card**

If a memory card is to be used with the Control Unit (CU), then the memory card must be inserted into the CU prior to being fitted on the Power Module (PM). Once the CU is fitted to the PM it is not possible to insert a memory card into the CU.

The Control Unit (CU) is snapped onto the Power Module as shown in the figure below. The CU is fitted in the following sequence:

<table>
<thead>

</tr>
</tbody>
</table>

Table 3-9  Summary of dimensions and tightening torques
1. Angle the CU to allow the lower hooks of the CU to fit into the lower recesses of the Power Module (PM).
2. Push the top of the CU towards the PM until it clicks into place.

Due to the PM230 having either a cover to remove or a door to be opened to access the actual PM the fitting of the CU and the removal of the CU slightly differs; the complete fitting and removal instructions are given below.

**Fitting and removing the CU to the PM230 FSA to FSC**

To fit the CU to the PM230 FSA to FSC the following procedure should be performed:

1. Remove the PM top cover by unscrewing the retaining screws of the cover (the screws are self-retaining and cannot be fully removed from the cover).
2. Fit the CU to the PM as previously described above.
3. All wiring of the CU and PM should be completed before proceeding further (refer to the wiring/connection section of this manual).
4. Ensure that the D-type adaptor is fitted to the CU D-type connector. See figures below.
5. Replace the PM cover, ensuring that all seals are intact to maintain the IP55 rating.
6. If an Operator Panel/Blanking Panel is to be fitted, ensure it is fitted once the top cover is replaced.

7. Tighten the retaining screws on the PM top cover (tightening torque 1.5 Nm [13.3 lbf.in]).

Removing the CU

The CU is removed from the PM by using the CU release lever which is located to the right-hand side of the internal fan. The lever is pushed towards the PM to release the CU (see figure below).

Figure 3-8 Fitting CU to PM230 FSA to FSC
Fitting and removing the CU to the PM230 FSD to FSF

Note
PM230 FSD to FSF door
The actual door of the PM230 (FSD to FSF) has been removed from the illustration to make the sequence of fitting simpler. The door, in reality, should never be removed from the PM230 enclosure.

To fit the CU to the PM230 FSD to FSF the following procedure should be performed:
1. Open the PM door, using the supplied key.
2. Fit the CU to the PM as previously described above.
3. All wiring of the CU and PM should be completed before proceeding further (refer to the wiring/connection section of this manual).
4. If an Operator Panel is to be used, ensure that the D-type adaptor is fitted to the CU D-type connector.
5. If an Operator Panel is to be fitted, ensure it is fitted before the door is closed.
6. Ensure that all seals are intact to maintain the IP55 rating.
7. Close and lock the PM door.

Fitting the D-type adapter retaining bracket

Figure 3-9  Adapter cable bracket FSD to FSF

A special bracket has been designed to ensure that the D-type adapter is fixed securely to the enclosure door. The bracket is fitted as shown in the figure below. The bracket and fixings are supplied with the product.
3.4 Fitting the IOP and the blanking plate

Overview

The Inverter has been designed to allow an Intelligent Operator Panel to be fitted to the front of the inverter.

If an IOP is not to be fitted to the Inverter, then the supplied blanking plate must be fitted to maintain the IP55/UL Type 12 rating.

The fitting of the IOP or blanking plate uses the same technique. To fit the IOP or blanking plate to the Inverter the following procedure should be performed:

Removing the CU

The CU is removed from the PM by using the CU release mechanism which is located to the right-hand side of the internal fan and just behind the top-rear of the CU.

The mechanism is pushed-down to release the CU.

Figure 3-10  Fitting CU to PM230 FSD to FSF
3.4 Fitting the IOP and the blanking plate

1. Fit the bottom-edge of the IOP or blanking plate into the panel recess on the front of the Inverter (see diagram below).
2. Push the IOP or blanking plate forward, towards the Inverter until it clicks into place (see diagram below).

Removal

To remove the IOP or blanking plate from the Inverter the following procedure should be performed.

1. Insert a small-bladed screwdriver into the cover recess to push down the IOP/Blanking Plate release mechanism (see figure below).
2. Pull the IOP/Blanking Plate forward, away from the housing.
3. The IOP/Blanking Plate can now be lifted from the bottom recess of the casing.

⚠️ CAUTION

Removal of IOP from the Inverter

The IOP has no internal, independent power supply; should the IOP be removed from the Inverter then all data store within the IOP’s memory will be lost.

If the IOP is removed from the Inverter during a process, such as, commissioning or parameter upload or download; that process will be interrupted and the Inverter will be in an unknown state and could result in an unstable system. Ensure that all processes (regarding the IOP) are completed before removing the IOP from the Inverter.
3.4 Fitting the IOP and the blanking plate

Figure 3-11  Fitting the IOP and blanking plate

Connecting

Electrical Installation

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Power and motor connections</strong></td>
</tr>
</tbody>
</table>

A fixed location, non varying connection is necessary because of a leakage current > 3.5 mA.

The inverter must always be grounded. If it is not grounded correctly, extremely dangerous conditions may arise which could prove potentially fatal.

Isolate the mains electrical supply before making or changing connections to the unit.

The terminals of the Inverter can carry dangerous voltages even if the inverter is inoperative. Wait at least 5 minutes to allow the unit to discharge after switching off the power supply before carrying out any installation work.

When connecting the power supply to the inverter, make sure that the terminal case of the motor is closed.

When changing from the ON to OFF-state of an operation if an LED or other similar display is not lit or active; this does not indicate that the unit is switched-off or powered-down.

Ensure that the inverter is configured for the correct supply voltage – it must not be connected to a higher voltage supply.

4.1 Power distribution systems

Overview of Power Distribution Systems

The power distribution systems described below, as defined in EN 60950, have been considered in the design of the inverter. In the next figures three phase systems are outlined. The three phase inverter must be connected to L1, L2 and L3. PE must always be connected. The inverter operates with most supply systems.

Table 4-1 Power distribution systems

</tbody>
</table>

A TN-S power system has separate neutral and protective ground conductors throughout the system. In a TN-C-S power system, the neutral and protective functions are combined in a single part of the system. In a TN-C power system, the neutral and protective functions are combined in a single conductor throughout the system. A TT power system has one point directly grounded, the exposed conductive parts of the installation being connected to a ground, which is electrically independent of the ground of the power system. An IT power system has no direct connection to ground - instead the exposed parts of the electrical installation are grounded.

Note

To ensure compliance for Class 1 protection in accordance with the EN 61140 directive, the input and output line voltage supplies must be earthed.

4.2 Operation only with grounded (TN) supplies

Operation only with grounded (TN) supplies

The SINAMICS PM230 Power Modules have integrated filters and therefore cannot be used in conjunction with IT or TT supplies.

Operation of the Power Modules without a protective earth is not permitted under any circumstances.
4.3 Motor cable lengths and cross-sections

Permissible Cable Length

The use of unshielded motor cables is possible. However to meet C1/C2 EMI classes, shielded cables with appropriate EMC installation are required.

The EMI classes relevant to the PM230 are explained below:

First Environment

An environment that includes domestic premises and establishments that are connected directly to a public low-voltage power supply network without the use of an intermediate transformer.

Note
For example: houses, apartments, commercial premises or offices in a residential building.

Category C1

Power Drive System (PDS) of rated voltage less than 1000 V intended for use in the First (Domestic) Environment.

Category C2

Power Drive System (PDS) of rated voltage less than 1000 V, which is neither a plug in device nor a movable device, and when used in the First (Domestic) Environment, is only intended to be installed and commissioned by a professional.

Note
A professional is a person or an organization having necessary skills in installing and/or commissioning a Power Drive System (PDS), including their EMC aspects.

The following cable specifications should be adopted to reach the standards indicated in the table below.
4.3 Motor cable lengths and cross-sections

* Power Modules with Class B integrated filters, frame sizes A to C, must be fitted with a ferrite ring on the motor cable between the Power Module power terminals and the screening plate of the Power Module to fulfill EMI category C1 conditions. Use Class 1 75°C copper wire only (for UL compliance).

Power Modules with Class B integrated filters, frame sizes B and C must be fitted with a ferrite ring on the mains supply input cable in addition to the ferrite ring on the motor cable.

---

**CAUTION**

The control cables must be laid separately from the power cables. The connection must be carried out as shown in the installation section in this manual, to prevent inductive and capacitive interference from affecting the correct function of the system.

**Note**

Ensure that the appropriate circuit-breakers or fuses with the specified current rating are connected between the power supply and the inverter. The technical specifications contain information about the circuit breaker and fuses. See Specifications.

---

**EMC cable glands**

To ensure compliance with the necessary EMC standards, it is recommended that all communications and I/O cables from the Control Unit are fitted through the gland plate using EMC compliant cable glands.

**CAUTION**

**Radiated emission compliance**

The PM230 Frame Sizes A to C inclusive, MUST use an EMC cable gland on the motor cable to comply with radiated emissions standards.

4.4 Access to power and motor terminals

Accessing the power and motor terminals

**WARNING**

Do not remove Inverter cover or open Inverter door during operation

This equipment contains dangerous voltages and controls potentially dangerous rotating mechanical parts. Non-compliance with the warnings or failure to follow the instructions contained in this manual can result in loss of life, severe personal injury or serious damage to property.

Protection in case of direct contact by means of SELV / PELV is only permissible in areas with equipotential bonding and in dry indoor rooms. If these conditions are not fulfilled, other protective measures against electric shock must be applied e.g. protective insulation.

Only suitably qualified personnel should work on this equipment, and only after becoming familiar with all safety notices, installation, operation and maintenance procedures contained in this manual. The successful and safe operation of this equipment is dependent upon its proper handling, installation, operation and maintenance.

The power supply, DC and motor terminals and thermistor cables can carry dangerous voltages even if the inverter is inoperative. The Control Unit can be powered from an external 230 V supply, if this is the case, then the external power supply must also be disconnected. Wait at least five minutes to allow the unit to discharge after switching off the line supply before carrying out any installation work.

It is strictly prohibited for any mains disconnection to be performed on the motor-side of the system; any disconnection of the mains must be performed on the mains-side of the Inverter.

When connecting the line supply to the Inverter, make sure that the terminal case of the motor is closed.

---

**CAUTION**

Cable cross section for grounding

The material of the protective earthing conductor must be the same as the material of the power cable. If not, the specific resistance of the protective earthing conductor must not be higher than the specific resistance of the power cables. The relevant diameter of the power cables is the diameter of the line supply cables, not the diameter of the motor cables.

For power cables up to 10 mm² (16 mm² Al) and 35 mm² the earth cable must be at least as big as the power cables.

For power cables larger than 10 mm² (Cu) or 16 mm² (Al) the earth cable must be at least 10 mm² (Cu) or 16 mm² (Al), but need not exceed these sizes.

For power cables with a diameter of more than 35 mm², the protective earthing conductor must have at least half of the size of the cross section of the power cable.
Frame sizes A ... C

The PM230 FSA to FSC have no terminal covers, but they do have detachable power terminals. Both power terminals can be removed to facilitate easier wiring of the Power Module. The PM230 FSA ... FSC front cover must be removed to gain access to the terminals.

The location and markings are shown in the figure below:

The style of the detachable connectors may vary for individual frame sizes, but the basic principle of use remains the same.

Figure 4-1  SINAMICS PM230 FSA to FSC power connections
Frame sizes D ... F

Frame size D to F of the PM230 have a terminal cover (in the form of a metal grill). The door of the Inverter must be fully opened to allow access to the terminal cover and the terminals. The terminal cover must be removed to gain full access to the power terminals. The location and fixings of the power terminals cover is shown in the figure below:

![Figure 4-2 SINAMICS PM230 FSD to FSF Terminal Cover](image-url)
4.5 Cable preparation

Preparation information

The table and the diagram below are provided to ensure that the cables for use with the PM power and motor terminals are prepared correctly.

No screening dimensions are given for the input power cables as these are not normally screened cables.

4.6 Wiring Sequence

Overview

Due to the nature of the Power Module enclosure, the following guidelines are given to provide a more effective and efficient sequence to ensure that the wiring of the Power Module is completed correctly.

Prerequisite actions

⚠️ DANGER

Ensure the Power Module has no power connect prior to installing cables and wiring

It is essential that during the installation phase of the cables and wiring of the Power Module that no power, in any form, is connected to the Power Module or the attached Control Unit.

If power has been applied to the Power Module or the Control Unit this MUST be disconnected. Once the power has been removed, the user should wait for at least 5 minutes before proceeding with the electrical installation of the Power Module.
Before the wiring of the Power Module can be performed, the following actions should be taken:

1. The Power Module must be mounted correctly as previously described in this manual.
2. The Power Module cover has been removed.
3. The Control Unit has been fitted correctly to the Power Module.
4. The Installer has reviewed the following instructions to ensure that all the necessary tools, to complete the wiring sequence, are available.
5. The Installer must be fully conversant with all necessary local and national safety regulations regarding electrical installation of industrial products.

Wiring sequence

To perform the correct wiring sequence, the following actions must be taken:

Step 1
Prepare the cables according to the dimensions given in the previous section of this manual.

Step 2
1. Remove the retaining screws from the gland plate.
2. Remove the gland plate.

Step 3
1. Fit the cable glands to the cables.
2. Ensure that the cable glands are unscrewed and the cables can move freely through the cable glands.

An EMC cable gland is required to be fitted to the motor power cable and the Control Unit cable to ensure EMC compliance.
Step 4
1. Fit a ferrite core to the motor cable, as shown in the diagram on the right (for Class B filtered variants only).
2. Connect the power and motor cables to the Power Module terminals.
3. Ensure the cables are correctly secured by the screening clamps.

Step 5
1. Push the gland plate against the Power Module base.
2. Ensure that the cables are pulled through the cable glands to remove excess cable from inside the Power Module housing.
3. Screw the gland plate securely into place with a maximum torque of 2.0 Nm (17.7 lbf.in)
4. Ensure that the seals are correctly in place to maintain the IP55 rating.
5. Tighten the cable glands to a maximum torque of 2.5 Nm (22.12 lbf.in).
6. Fit grommets to the gland plate holes that have no cables.

The grommets are provided in the Accessory Bag provided with the product.
4.7 Power and motor connections

Power and motor terminal layout

The figure below show the layout of the power and motor terminals of the Power Module. The figure also includes the tightening torques for the terminals.

Figure 4-3 Power and motor terminal layout for FSA ... FSF
4.8  Gland plate installation

Overview

The Inverter enclosure has a gland plate fitted to the bottom of the unit with pre-drilled guide holes to allow the power and control cables to be taken from the unit whilst maintaining the EMC requirements and IP55/UL Type 12 rating.

In the figures below the gland plate and its fittings are described.

If a guide hole is not used, then a grommet must be used to maintain the seal of the gland plate.

When replacing the gland plate, it is important to ensure that the seal at the bottom of the unit is correctly fitted and the correct tightening torques are used to ensure the IP55 rating of the Inverter.

EMC cable glands

To ensure compliance with the necessary EMC standards, it is recommended that all communications and I/O cables from the Control Unit are fitted through the gland plate using EMC compliant cable glands.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
</table>

**Radiated emission compliance**

The PM230 Frame Size A to F inclusive, MUST use an EMC cable gland on the motor cable to comply with radiated emissions standards.

An example of an EMC cable gland is given in the figure below. In the example below the cable gland also provides protection to the IP68 standard when correctly fitted to the gland plate.
Connecting

4.8 Gland plate installation

Brass-nickel plated EMC cable gland with metric thread as per EN50262. IP68 protection with up to 15 bar pressure.

Gland plate hole dimensions

In the table below the dimensions of the gland plate holes for all frame sizes of the PM230 are given. The cable glands are not supplied with the product but grommets are supplied with the product.

The size of the actual cable glands should be dimensioned to fit snugly into the appropriate cable gland hole to ensure the IP55 rating of the Inverter.

4.8 Gland plate installation

Figure 4-5  PM230 gland plates FSA to FSC

Figure 4-6  PM230 gland plates FSD to FSF
4.9 EMC guidelines

4.9.1 Avoiding electromagnetic interference

Only the concurrent use of filtering, grounding and shielding ensure an installation in accordance with the EMC requirements.

The next sections cover all of the most important rules for the installation of inverter and drive systems.

4.9.2 Connections and interference suppression

All connections should be made so that they are permanent. Screwed connections on painted or anodized metal components must be made either by means of special contact washers, which penetrate the isolating surface and establish a metallically conductive contact, or by removing the isolating surface on the contact points.

Contactor coils, relays, solenoid valves, and motor holding brakes must have interference suppressors to reduce high-frequency radiation when the contacts are opened (RC elements or varistors for AC current-operated coils, and freewheeling diodes for DC current-operated coils). The interference suppressors must be connected directly on each coil.

4.9.3 Cabling

Cables

- All cable lengths must be minimized (excessive cable lengths must be avoided).
- Signal and data cables, as well as their associated equipotential bonding cables, must always be routed in parallel and with as short a distance as possible.
- Spare wires for signal and data cables must be grounded at both ends to create an additional shielding effect.
- All power cables (line supply cables, as well as motor cables) must be routed separately from signal and data cables. The minimum distance should be approximately 25 cm.
- The power cable between inverter and motor must be shielded. A symmetrical, 3-wire, three-phase cable should be used here. Shielded cables with symmetrical three-phase conductors (L1, L2, and L3) and an integrated, 3-wire, and symmetrically arranged PE conductor are ideal for this purpose.
- The shielded power cable to the motor must be routed separately from the cables to the motor temperature sensors (PTC/KTY), since the latter two are treated as signal cables.
- Signal and data cables must be shielded to minimize coupled-in interference with respect to capacitive, inductive, and radiative coupling.
- Particularly sensitive signal cables, such as setpoint and actual value cables must be routed with optimum shield bonding at both ends and without any interruptions of the shield.
Cable shields

- Shielded cables must have finely stranded braided shields. Foil shields are not suitable since they are much less effective.
- Shields must be connected to the grounded housings at both ends with excellent electrical conductivity and a large contact area. Only when this method is used coupled-in interference with respect to capacitive, inductive, and radiative coupling can be minimized.
- Bonding connections for the cable shields should be established, where ever possible, directly behind the cable entry into the inverter. For signal and data cables the shield bonding options provided in the cabinet units should be used.
- Cable shields should not be interrupted, wherever possible, by intermediate terminals.
- In the case of both, the power cables and the signal and data cables, the cable shields should be connected by means of suitable EMC shield clips or via electrically conductive PG glands. These must connect the shields to the shield bonding options for cables and the unit housing respectively with excellent electrical conductivity and a large contact area.
- As plug connectors for shielded data cables (e.g. PROFIBUS cables) only metallic or metallized connector housings should be used.

4.9.4 Equipotential bonding

Equipotential bonding within the drive system has to be established by connecting all electrical and mechanical drive components (transformer, motor and driven machine) to the grounding system. These connections are established by means of standard heavy-power PE cables, which do not need to have any special high-frequency properties. In addition to these connections, the inverter (as the source of the high-frequency interference) and all other components in each drive system (motor and driven machine) must be interconnected with respect to the high-frequency point of view. For this purpose cables with good high-frequency properties must be used.
Grounding and high-frequency equipotential bonding measures

The following figure illustrates all grounding and high-frequency equipotential bonding measures using an example with a SINAMICS G120P.

![Diagram of grounding and high-frequency equipotential bonding measures](image)

1. Conventional grounding system without special high-frequency properties
2. High-frequency equipotential bonding
3. Connect shield with a large contact area
4. Connect shield via electrically conductive PG gland
5. Internal connection with high-frequency properties

Figure 4-7 Grounding and high-frequency equipotential bonding measures in the drive system and in the plant

The ground connections 1 represent the conventional grounding system for the drive components. They are made with standard, heavy-power PE conductors without special high-frequency properties and ensure low frequency equipotential bonding as well as protection against injury.

The line supply cable of the inverter can be unshielded. The inverter has to be grounded by this cable.

The shielded motor cable provides high-frequency equipotential bonding between the inverter and the motor terminal box. The shield of the motor cable has to be connected to the EMC shield busbar 3 in the inverter by the integrated shield clips with a large contact area. On the motor side the shield has to be connected to the terminal box via an electrically conductive PG gland 4.
The shield of the signal cable between the Control Unit and an external controller has to be connected to the gland plate via an electrically conductive PG gland \( \odot \) and on the other end to the shield bonding options of the controller cabinet directly behind the cable entry.

The connection \( \odot \) provide solid bonding for high-frequency currents between the metal housing of the inverter and the PE busbar. This connection should be made with short, finely stranded, braided copper wires with a large cross-section (\( \geq 95 \text{ mm}^2 \)).

### Additional measures

Finely stranded, braided copper cables have to be routed in parallel with the cable shields in the following cases:

- Old installations with already existing unscreened cables
- Cables with poor high-frequency properties
- Installations with bad grounding systems

The connections in the figure below provide a solid, high-frequency bonding between the motor housing, the motor terminal box, the driven machine and the EMC busbar of the inverter.

![Figure 4-8 Additional high-frequency bonding of the drive system](image-url)
4.9.5 Inverter shielding in detail, FSA to FSC

The figure below shows the necessary shielding of the Power Module.

![Power Module shielding diagram]

Figure 4-9  Power Module shielding, FSA … FSC

If a terminal wiring of the Control Unit is required, a shielded cable has to be used. The cable shield has to be connected to the gland plate via an electrically conductive PG gland. This cable has to be fed through the left-hand hole of the gland plate, especially on frame size C filter class B Power Modules.
Fitting ferrite rings to the motor and mains supply cables

Motor cable blue ferrite ring
It is necessary to fit the blue ferrite ring to the motor power cable on the PM230 frame sizes A to C (0.37 kW ... 15.0 kW) with an integrated B class filters to ensure it fulfills the EMI C1 standard for conducted emissions.

The blue ferrite ring must be fitted between the motor power cable terminals and the screening plate of the power module.

The ferrite rings should not be used on cable lengths greater than 25 m (80 ft).

The ferrite rings required for PM230 FSA to FSC with integrated Class B filters are supplied with the product.

Mains supply cable ferrite rings
It is necessary to fit the gray ferrite rings to the mains supply cable of the PM230 frame size B (4.0 kW ... 7.5 kW) and frame size C (11.00 kW ... 15.0 kW) with an integrated B class filter to ensure it fulfills the EMI standard for radiated emissions.

The gray ferrite rings must be fitted between the terminals and the screening plate on the mains supply cable.

The gray ferrite rings are supplied with the product.

The correct fitting of the ferrite rings is shown in the figure below.
Connecting

Figure 4-11 Fitting ferrite rings to motor and mains supply cables
Service and maintenance

5.1 Maintenance

5.1.1 Maintenance

The purpose of maintenance is to preserve the specified condition of the Power Module. Dirt and contamination must be removed regularly and parts subject to wear replaced. The Power Module comprises mostly electronic components. Apart from the fan(s), the unit, therefore, contains hardly any components that are subject to wear or that require maintenance or servicing.

The following points must generally be observed.

5.1.2 Cleaning

Ventilation

When installing the devices, make sure that the ventilation slots are not obstructed. The fan must be checked to make sure that it is functioning correctly.

Cable and screw terminals

Cable and screw terminals must be checked regularly to ensure that they are secure in position, and if necessary, retightened. Cabling must be checked for defects. Defective parts must be replaced immediately.

Note

The actual intervals at which maintenance procedures are to be performed depend on the installation conditions and the operating conditions.

Siemens offers its customers support in the form of a service contract. For further details, contact your regional office or sales office.
5.2 Replacing components

5.2.1 Replacing the cooling fan

The service life of the cooling fan

The average service life of the cooling fans is 40,000 hours. In practice, however, the service life may deviate from this value. Especially a dusty environment can occlude the fan.

The fan must be replaced in good time to ensure that the inverter is available.

Replacing the external cooling fan FSA ... FSC

The PM230 Power Modules have two sets of cooling fans, one fan is internal and the other is external. The external cooling fan is mounted at the rear of the Power Module.

The external cooling fans on the PM230 FSA to FSC are a complete fan modules and do not require any tools to remove and replace the fans. The power connection on the fan unit is an integral part of the fan module and does not require separate removal.

Preparatory steps

- Power-down the inverter
- Remove the Operator Panel from the Power Module
- Allow at least 5 minutes for the Power Module to completely discharge
- Disconnect all the cables from the Power Module
- Place the Power Module face-down on a clean and safe surface

Removal

1. Place your fingers into the two fan housing recesses (indicated in the figure below as ①).
2. Push your fingers together to release the fan module retaining clips.
3. Pull the fan module out (indicated in the figure below as ②).
Installation

For re-installation, carry out the above steps in reverse order.
Replacing the external cooling fan FSD … FSF

The PM230 Power Modules have two sets of cooling fans, one fan is internal and the other is external. The external cooling fans at the top of the Power Module.

The external cooling fans on the PM230 FSD to FSF are a complete fan modules.

Preparatory steps

- Power-down the inverter
- Remove the Operator Panel from the Power Module
- Allow at least 5 minutes for the Power Module to completely discharge
- Disconnect all the cables from the Power Module
- Place the Power Module face-down on a clean and safe surface

Removal

1. Using a posi-drive screwdriver, remove the fan retaining screws (indicated in the figure below as ①).
2. Pull the fan housing forward and remove the power connector for the fan modules (indicated in the figure below as ②).
   On FSD/FSE the power connector is located to the right of the fans, attached to the back of the fan housing plate. On FSF the power connector is located in between the two fans, attached to the back of the fan housing plate. The connector is shown in the figure below as a dashed-line outline because it is not visible from the front of the fan housing plate.
3. Pull the fan module out (indicated in the figure below as ③).
Figure 5-2  SINAMICS PM230 FSD ... FSF fan replacement

Installation

For re-installation, carry out the above steps in reverse order.
Replacing the internal cooling fan FSA ... FSC

The PM230 Power Modules have two sets of cooling fans, one fan is internal and the other is external. The internal cooling fan is mounted inside at the top of the Power Module housing.

The internal cooling fan on the PM230 FSA to FSC is a complete fan modules and does not require any tools to remove and replace the fan. The power connection on the fan unit is an integral part of the fan module and does not require separate removal.

Preparatory steps

- Power-down the Inverter (ensure that all external power sources are disconnected)
- Remove any external power to the Control Unit
- Allow at least 5 minutes for the Power Module to completely discharge.
- Remove the Power Module cover

Removal

1. Disconnect the fan module power lead (indicated in the figure below as ①).
2. Press down on the fan module release clip (indicated in the figure below as ②).
3. Pull the fan module out of the guide rail (indicated in the figure below as ③).

![Removing internal fan](figure5-3.png)

Installation

1. Fit the fan module into the guide rail.
2. Push the fan module until the release clip clicks into place (indicated in the figure above as ①).
3. Connect the fan module power lead (indicated in the figure above as ②).
4. The fan module installation is now complete.

Replacing the internal cooling fan FSD ... FSF

The PM230 Power Modules have two sets of cooling fans, one fan is internal and the other is external. The internal cooling fan is mounted inside at the top of the Power Module housing. The internal cooling fan on the PM230 FSD to FSF is a complete fan modules and require only a posi-drive screwdriver to remove and replace the fan module. The power connection on the fan module is an integral part of the fan module and does not require separate removal.

Preparatory steps

- Power-down the Inverter (ensure that all external power sources are disconnected)
- Remove any external power to the Control Unit
- Allow at least 5 minutes for the Power Module to completely discharge.
- Open the enclosure door.

Removal

1. Disconnect the fan module power lead (indicated in the figure below as ①).
2. Remove the fan module retaining screw (indicated in the figure below as ②).
3. Unhook the fan module from the fan module housing (indicated in the figure below as ③).
4. Pull the fan module forward, clear of the fan module housing.
5.2 Replacing components

Installation

1. Hook the fan module into the fan module housing (indicated in the figure above as ①).
2. Push the fan module towards the fan module housing (indicated in the figure above as ②).
3. Replace the fan module retaining screw and tighten.

Figure 5-4 FSD to FSF internal fan replacement
4. Connect the fan module power lead (indicated in the figure above as ③).
5. The fan module installation is now complete.

5.2.1.1 Replacement fans

Replacement fans order details
The external and internal cooling fans of the PM230 are customer replaceable self-contained modules. Listed below are the order details of the various fan assembles. It should be noted that these fan assemblies are complete modules and require no other components.

5.3 Spares and accessories
Technical specifications

High Overload and Low Overload

The Inverters have different power ratings for "High Overload" and "Low Overload".

The load characteristics are given below and refer to a duty cycle of 300 s. In case of no further specification or in the case of rated values, the values always refer to low overload.

![Permissible overload for Low Overload (LO)](image1)

![Permissible overload for High Overload (HO)](image2)

Figure 6-1  Duty cycle, High Overload and Low Overload

Note

Please note that 100 % power or current for Low Overload is higher than 100 % for High Overload.

The load characteristics shown in the diagram are only examples. We recommend the use of the "SIZER" engineering software to select the appropriate Power Modules using duty cycles. See section.

6.3 Specifications

6.3.1 Input current operation

**Note**
The Power Module is only for operation at a maximum line impedance of 1% $V_k$. No line reactor can be used with the Power Module.

**NOTICE**
UL-certified fuses must be used
In order that the system is in compliance with UL, UL certified fuses, circuit breakers or self-protected combination motor controllers must be used.

A.1 Electromagnetic Compatibility

Electromagnetic compatibility

All manufacturers/assemblers of electrical apparatus which "performs a complete intrinsic function and is placed on the market as a single unit intended for the end user" must comply with the EMC directive EC/89/336.

There are three routes for the manufacturer/assembler to demonstrate compliance:

Self-certification

This is a manufacturer's declaration that the European standards applicable to the electrical environment for which the apparatus is intended have been met. Only standards that have been officially published in the Official Journal of the European Community can be cited in the manufacturer's declaration.

Technical construction file

A technical construction file can be prepared for the apparatus describing its EMC characteristics. This file must be approved by a 'Competent Body' appointed by the appropriate European government organization. This approach allows the use of standards that are still in preparation.

EMC Standards

The SINAMICS G120 drives have been tested in accordance with the EMC Product Standard EN 61800-3:2004.

A.2 Definition of the EMC Environment and Categories

Classification of EMC performance

The EMC environment and categories are defined within the EMC Product Standard EN 61800-3, as follows:
Appendix
A.2 Definition of the EMC Environment and Categories

First Environment
An environment that includes domestic premises and establishments that are connected directly to a public low-voltage power supply network without the use of an intermediate transformer.

Note
For example: houses, apartments, commercial premises or offices in a residential building.

Second Environment
An environment that includes industrial premises and establishments that are not connected directly to a public low-voltage power supply network.

Note
For example: industrial and technical areas of buildings fed from a dedicated transformer.

Category C1
Power Drive System (PDS) of rated voltage less than 1000 V intended for use in the First (Domestic) Environment.

Category C2
Power Drive System (PDS) of rated voltage less than 1000 V, which is neither a plug in device nor a movable device, and when used in the First (Domestic) Environment, is only intended to be installed and commissioned by a professional.

Note
A professional is a person or an organization having necessary skills in installing and/or commissioning a Power Drive System (PDS), including their EMC aspects.

Category C3
Power Drive System (PDS) of rated voltage less than 1000 V intended for use in the Second (Industrial) Environment and not intended for use within the First (Domestic) Environment.
Appendix

A.3 EMC overall performance

Category C3

Power Drive System (PDS) of rated voltage less than 1000 V intended for use in the Second (Industrial) Environment and not intended for use within the First (Domestic) Environment.

<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category C1 - First Environment</td>
<td>The inverters with integrated Class B filters meet the requirements for category C1 for conducted emissions.</td>
</tr>
</tbody>
</table>
| Category C2 - First Environment - Professional Use | 6SL3223-0DE**-*A*0 (integrated class A filter)  
6SL3223-0DE**-*B*0 (integrated class B filter)  
Class A: 25 m screened cable type CY  
All units have integrated Class A or Class B filters  
When used in the First Environment this product may cause radio interference in which case mitigation measures may be required. Units require supply authority acceptance for connection to the public low-voltage power supply network. Please contact your local supply network provider. |
| Category C3 - Second Environment | Unfiltered Variants There are not unfiltered variants of the PM230 Power Module |

Note

All drives should be installed and commissioned in accordance with the manufacturer's guidelines and in accordance with good EMC practices.

For further information refer to SIEMENS application note "EMC Design Guidelines".

A.3 EMC overall performance

EMC Emissions

The SINAMICS G120 drives have been tested in accordance with the emission requirements of the category C2 (domestic) environment.

Table A-2 Conducted & Radiated Emissions

<table>
<thead>
<tr>

<td>C1 and C2</td>
</tr>
<tr>
<td>Radiated Emissions</td>
<td>IEC61800-3</td>
<td>C2</td>
</tr>
</tbody>
</table>
Appendix
A.3 EMC overall performance

Note
To achieve this performance the default switching frequency should not be exceeded. The PM230 complies with the above mentioned EMC emission requirements, only at the default settings of the Power Module.

The limits will not be met if the drive is not installed in accordance with good EMC practices.

Harmonic Currents

The harmonic current emissions from the SINAMICS PM230 is as follows:

Table A-3 Harmonic Currents

<table>
<thead>
<tr>
<th>Rating</th>
<th>5th</th>

<td>5.3</td>
<td>4.3</td>
<td>4.0</td>
</tr>
</tbody>
</table>

Note
Units installed within the category C2 (domestic) environment require connection to the public low-voltage power supply network. Please contact your local supply network provider.

Units installed within the category C3 (industrial) environment do not require connection approval.

EMC Immunity

The SINAMICS PM230 has been tested in accordance with the immunity requirements of category C3 (industrial) environment:

#### European Low Voltage Directive

The SINAMICS G120 product range complies with the requirements of the Low Voltage Directive 2006/95/EC. The units are certified for compliance with the following standards:

- EN 61800-5-1 — Semiconductor inverters –General requirements and line commutated inverters
- EN 60204-1 — Safety of machinery –Electrical equipment of machines

#### European Machinery Directive

The SINAMICS G120 inverter series does not fall under the scope of the Machinery Directive. However, the products have been fully evaluated for compliance with the essential Health & Safety requirements of the directive when used in a typical machine application. A Declaration of Incorporation is available on request.

#### European EMC Directive

When installed according to the recommendations described in this manual, the SINAMICS G120 fulfils all requirements of the EMC Directive as defined by the EMC Product Standard for Power Drive Systems EN 61800-3

#### ISO 9001

Siemens plc operates a quality management system, which complies with the requirements of ISO 9001.

Certificates can be downloaded from the internet under the following link:

Note

The immunity requirements apply equally to both filtered and unfiltered units.
